

Customized
system solutions
for automation and assembly technology

BÄR

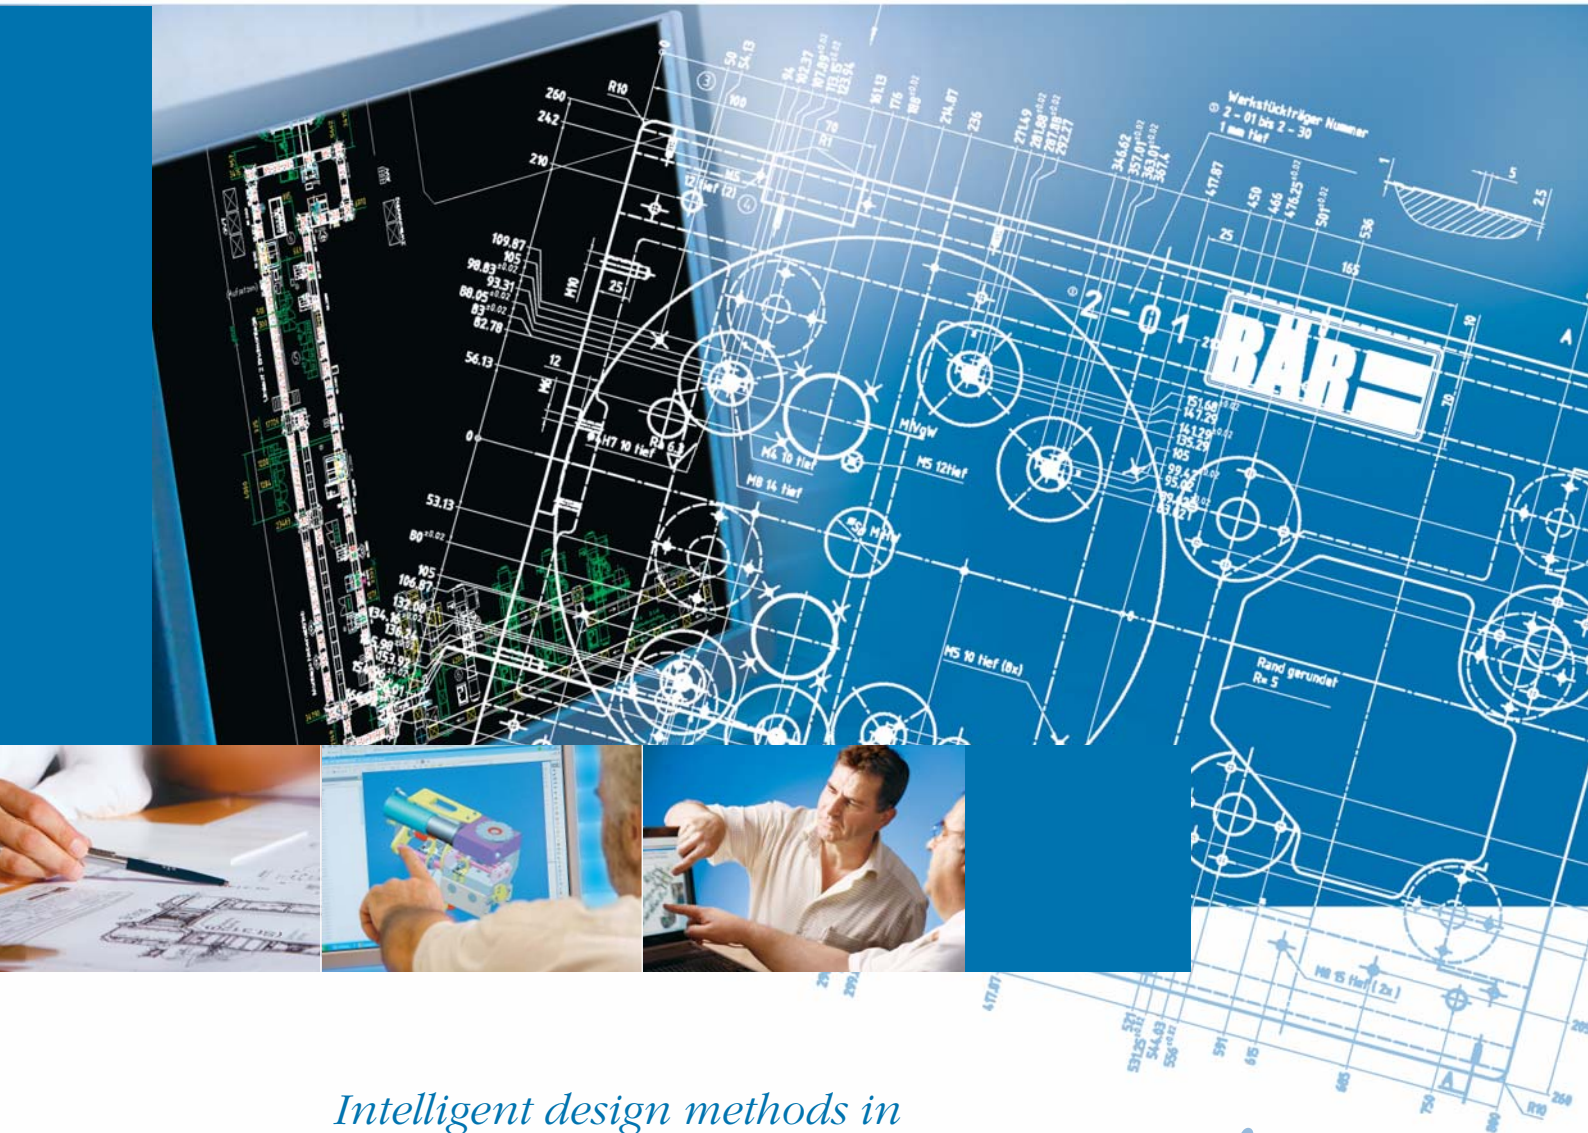

The age of factory automation is the age of innovation

In the value-added chain of industrial manufacturing processes, the automation of production, logistics and information processes is becoming an ever more critical success factor. Organizations investing in this intelligent technology of robotic process chains are opening up opportunities for innovative system solutions, which lead to increased productivity, reduced manufacturing costs and top quality.

At BÄR, we offer our customers tailor-made system solutions, always incorporating the most up-to-date technology.

Intelligent design methods in
process automation
increase the efficiency of your production processes

The quality of our system solutions is determined by flexible and efficient design and planning. Using new application methods, experienced specialists create rational work processes and process chains. Our development and design departments use state-of-the-art CAD technology.

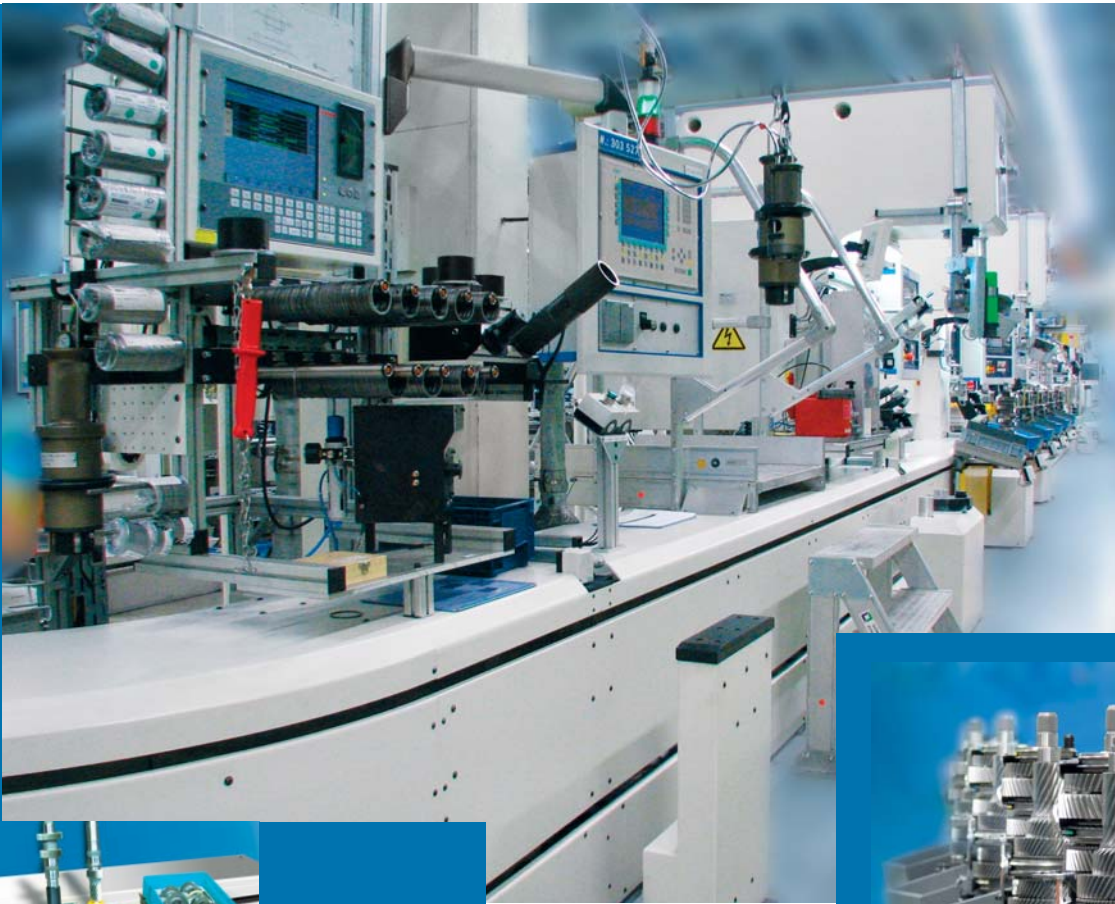

Working in close cooperation with you, our experienced team comes up with marketable ideas and customized automation systems in no time.

We use PC-controlled systems to automate complete production processes. Networked process chains considerably shorten working steps and throughput times to save costs.

Using state-of-the-art machine elements creates new methods of plant configuration. The result is a dynamic system solution with perfect automation technology, high availability and superior efficiency.

A result which bears our name.

*Innovative automation technology – your
guarantee for success
and competitiveness*

Production volume, product life cycle, parts weight, parts complexity and variety are the determining factors for the layout of an automation system.

The degree of automation has to be economically viable and intelligent. From manual and adaptive production systems to flexibly automated cells to full automation: BÄR offers the perfect solution for almost every production process. Our varied handling and assembly modules are the basis for turn-key facilities from one source.

Modular high-speed handling systems which are extremely accurate and precise, or screw pickups for use in flexible manufacturing systems are examples of automatic applications for all areas of application, based on the principle of rational production using modular, proven equipment and linking them to your manufacturing process.

Contact us – we have the right automation concept for adding value to your process chain, too.

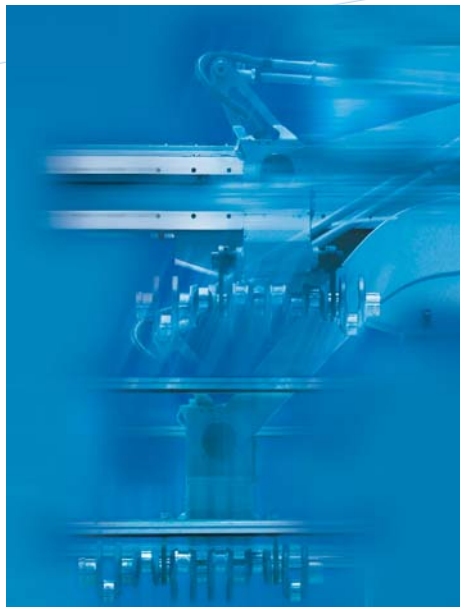

A state-of-the-art
automation system
ensures top product quality

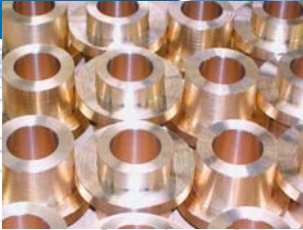

Volatile markets need flexibility and adaptable production methods.

A successful business depends on people who continuously set new standards by applying their knowledge and skills. By focusing on customised automation systems we have created a platform for new applications and uses in assembly technology, handling technology, industrial handling, mechanical engineering, pneumatics and electrical automation.

Our strength lies in the ability to combine standard BÄR components with special designs to deliver highly flexible customized system solutions at an excellent cost-performance ratio. We design machines and facilities in the areas of:

- handling technology
- material flow technology
- modular storage systems
- assembly technology
- packaging technology

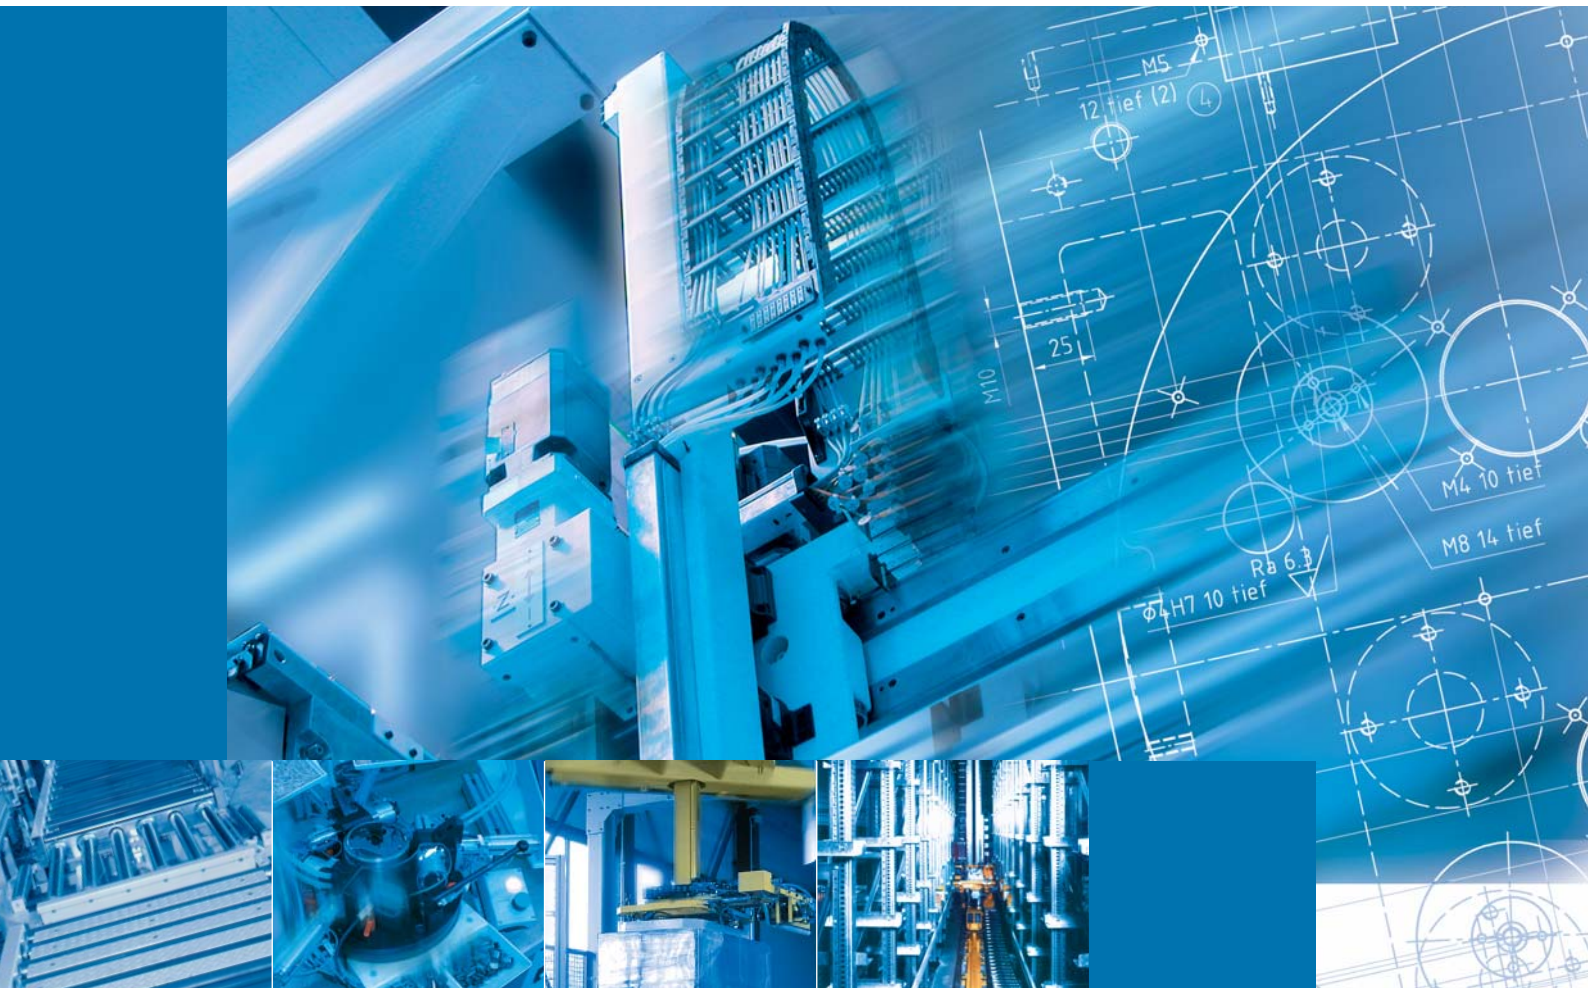

*The satisfaction
of our customers is
the yardstick for our
perfect service.*

Our customers are companies from all areas of industry: automotive industry including OEMs, machine tool manufacturers, the packaging and the chemical industry. Each appreciates our after-sales service and our zero-error strategy. If a problem does happen to occur, our service engineers will fix it immediately either on site or via the telephone hotline. Our range of services also includes the maintenance of your facility, as well as induction and training for your operators. Regular customer information about innovations are a matter of course.

Contacts are established through connections. Benefit from our experience and know-how as a specialist in automation technology with a comprehensive range of expertise:

*Your competent
systems partner for
automation systems*

- handling technology
- material flow technology
- modular storage systems
- assembly technology
- packaging technology

Let our skills speak for themselves.
